PROFILE

Final-year Computer Science (AI) student at Nottingham Trent University, graduating June 2026 with First Class Honours. I work where technical depth meets people: at Apple I diagnose technical problems for customers every day and explain the trade-offs in plain language, and across my own projects I design and ship full-stack solutions end to end. I read and write code comfortably in Java, Python and JavaScript and work across the web stack, with a track record of debugging customer-facing issues and turning ambiguous problems into something that works. Sitting between engineering, product and the people who actually use the thing is the part of this job I'm drawn to most.

EDUCATION

Nottingham Trent University

Sep 2023 - Jun 2026

BSc (Hons) Computer Science (Artificial Intelligence) · First Class Honours · Clifton Campus, Nottingham

Relevant modules: Service-Centric & Cloud Computing (REST, web services, SOA); Practical Project Management & Professional Development; Software Design & Implementation (Java, OOP, data structures); Systems Software (distributed systems, Docker, networking); Distributed Database Engineering (SQL, Hadoop, MongoDB); Artificial Intelligence.

TECHNICAL SKILLS

Languages	Java, C++, Python, JavaScript / Node.js, SQL
Web & front-end	HTML, CSS, JavaScript, React, REST APIs, JSON
Solution engineering	REST / SOA service design, microservices, API integration, Docker, distributed systems (load balancing, Hadoop / MapReduce)
Data & SQL	PostgreSQL, MySQL, SQLite, MongoDB; SQL querying, schema design, indexing, parameterised queries
Consulting & delivery	Stakeholder communication, translating technical concepts for non-technical audiences, debugging customer-facing issues, Agile / Scrum, technical documentation
Tools & more	Git, Maven, Linux, automated testing (Jest); applied AI (Gemini, NLTK, TF-IDF)

SELECTED PROJECTS

Online Bidding System - Final Year Project

Oct 2025 - Apr 2026

React · Node.js · Express · PostgreSQL · MongoDB Atlas · JavaScript · Socket.io · Render

- Designed and shipped a full-stack web application end to end: a React and JavaScript front end over a Node and Express API, deployed live to Render, with real-time bidding on Socket.io and a Gemini-powered assistant built into the product.
- Built on an immutable double-entry wallet ledger with ACID transactions so balances always reconcile, and secured with JWT, OAuth, RBAC and rate limiting.
- Delivered across eight Agile sprints with a 37-test suite passing at 100% and API responses under 500ms, debugging issues end to end from the front end through to the database.

Load Balancer & Distributed File Transfer System

2024 - 2025

Java · JavaFX · Docker & Docker Compose · MySQL · SQLite · Linux

- Designed a distributed system across six Docker containers (a load balancer, four storage nodes and a MySQL server) with automatic health checks that route traffic away from a failed node without dropping requests.
- Built a real-time monitoring console tracking node health, queue depth and throughput, alongside four scheduling algorithms with semaphore concurrency control and starvation prevention.
- Diagnosed and fixed failures across containers, databases and the network layer to keep the system available under concurrent load.

CycleNest - Java REST API Service

Oct 2025 - Apr 2026

Java · Apache Tomcat · REST · JSON · MongoDB · AWS EC2 · SOA

- Designed and built a RESTful service for a peer-to-peer rental marketplace on service-oriented principles: clean endpoints over correct HTTP verbs with JSON, deployed to cloud infrastructure and validated against 10,000+ records.

Further: Distributed big-data analysis on a three-node Hadoop cluster (Java, HDFS, MapReduce); a multi-modal AI chatbot (Python, NLTK, TF-IDF, CNN); autonomous robot navigation in ROS2 and Docker.

EXPERIENCE

Apple Inc. - Technical Specialist

Jul 2025 - Present

Leicester Highcross

- Singled out by the management team as a go-to person for customers with technical doubts, trusted with the more complex technical questions that come in.
- Own the technical relationship with customers day to day: diagnosing and resolving issues across Apple's hardware and services, including iCloud sync, Apple ID authentication and MDM device management, and seeing each one through to a fix.
- Translate complex technical trade-offs into clear, plain-language advice for non-technical people, so they can make a confident decision rather than just receiving a spec.
- Work through unfamiliar problems under time pressure, diagnosing at the system level to find the real cause rather than the surface symptom.
- Earned Blue Orchid status, Apple's recognition for exceeding expectations on customer satisfaction, productivity and collaboration, and ranked 2nd in the team for business introductions.

CERTIFICATIONS & ACTIVITIES

SQL for Data Science, UC Davis (Coursera, May 2026) · Quantum Software Engineering Job Simulation, Forage (Jun 2026) · Student Mentor, NTU (2023-2026) · State-level Badminton Champion (India) · Interests: technical problem-solving, web and cloud platforms, the mobile app ecosystem; gym training.
